Patagonian Ecology
SFS 3781

The School for Field Studies (SFS)
Center for Climate Studies (CCS)
Puerto Natales, Chile

This syllabus may develop or change over time based on local conditions, learning opportunities, and faculty expertise. Course content may vary from semester to semester.
Course Overview

This course focuses on ecology as a discipline, biodiversity, and the Patagonian ecoregions and habitats that have evolved with short growing seasons, tenacious southwesteley winds, and fierce winters. We will examine the ecology and evolution of faunal species such as Guanaco (related to the llama), Magellanic and King penguins, and the flightless Rhea, most of them endemic to the region, and the largest animal of them all, the Blue Whale. We will explore ecological succession, including primary succession, which is how life recruits into new environments, such as bare rock after glacial retreat, or new, igneous rock after volcanic eruption. Though flora is not particularly diverse here in southern Patagonia (save for the lichens and bryophytes), the floral structural complexity is fascinating.

We will explore a remarkable latitudinal gradient—from Cape Horn in the south to Chiloé Island’s milder, temperate climate—a latitudinal change equivalent to traveling from Massachusetts to Florida. Thematically, we will traverse alpine ecology, exposed terrestrial ecology, coastal ecology, marine ecology, and fire ecology. From the central focus on the theory and practice of ecology, we will expand to investigate relationships between people and nature in conservation, resilience, and environmental challenges. We will explore the role of protected areas in conservation, including private protected areas that have emerged in Chile; invasive species; human history on landscapes; agriculture, plantation forests, and aquaculture; and current and predicted changes due to climate change.

The course is constructed so that the lens of climate shifts and perturbations will be central to discussions and observations; it will encompass not only climate threats, but an understanding of the role of nature in climate adaptation and mitigation, and the role of Chilean climate policy and commitments in an international community.

Learning Objectives

A fundamental skill in ecology is the ability to identify organisms, in order to document their interactions with each other and the environment. Field and lab practicums will feature plant, bird, and mammal identification portions. In a shared goal with the Earth Systems and Climate course, students will be able understand and articulate the mechanism of global warming where heat is trapped within the atmosphere, and identify the anthropogenic signature of climate change.

Student Learning Outcomes

1. Understand the constraints of life at high-latitude, starting with the energetic constraints of a short growing season, in a steep elevation gradient from sea level to high alpine environments.
2. Gain the ability to “read” landscapes for the climate and ecological relationships that shape them, skills that will be put into play when reading the vastly different landscapes on different field expeditions.
3. Demonstrate your ability to identify a new suite of plant, animal, bird, and marine organisms in the field.
4. Integrate multiple forms of learning in a field notebook – observation, expert knowledge, and mapping of concepts onto real landscapes and seascapes – and use this documentation to develop new questions, hypotheses, and research.
5. Understand the richness of life forms and their interactions – herbivory, predation, parasitism, mutualism, co-evolution and facilitation – and how the nature and timing of interactions may be shifting with climate change.

6. Employ field methods and analytical tools – qualitative and quantitative – that are used in ecology and social-ecological studies.

7. Articulate climate-change impacts and solutions at multiple scales, from local to global. Understand the role of nature in climate adaptation and mitigation, and the role of Chilean climate policy and commitments in an international community.

Thematic Components and Research Direction

The overarching question we address in the CCS curriculum is:

*How can Chile respond to local and global challenges while securing the functionality of its natural and human systems?*

Assessment

The evaluation breakdown for the course is as follows:

<table>
<thead>
<tr>
<th>Assessment Item</th>
<th>Value (%)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Participation</td>
<td>10</td>
</tr>
<tr>
<td>Quizzes</td>
<td>15</td>
</tr>
<tr>
<td>Field Exercise 1</td>
<td>10</td>
</tr>
<tr>
<td>Field Exercise 2</td>
<td>15</td>
</tr>
<tr>
<td>Field notebook</td>
<td>20</td>
</tr>
<tr>
<td>Exam</td>
<td>30</td>
</tr>
<tr>
<td><strong>TOTAL</strong></td>
<td><strong>100</strong></td>
</tr>
</tbody>
</table>

Participation and topic discussions (10%)

Everybody should be prepared for each academic session. This implies reading the materials for each session with enough detail to be able to ask relevant questions; and to participate in analytical discussions about the key issues. Active participation during classes, discussions, assignments and hikes is expected.

Quizzes (15%)

Three short quizzes will be used to evaluate the classroom and field lectures.

Field Exercises (FEX)

Two field exercises will be conducted. With these FEXs students will gain experience for the Directed Research component at the end of the semester. The FEXs require field observation, data collection and report writing.

*Context:* Science is based on intuition, logic and reason. The scientific method begins with an *observation*; we seek *patterns* and then formulate *hypotheses* that could explain those patterns. We can
also use experiments to test hypotheses. Finally, we conclude on the results thus contributing to a broader theory.

**Objective:** Our objective is to develop observation skills in the field and to learn the process of the scientific method.

**FEX 1 (10%)**

**Subject:** Observational skills, hypothesis testing, and animal census techniques

**Methods:** We will use the dramatic range of Torres del Paine National Park as a natural laboratory, from the high-alpine rock, ice, and glaciers, to the lower-elevation steppes where we can observe guanaco, Andean condor, and other wildlife. Students will be provided with theory during the orientation hikes and guidance in the process of observation, hypothesis formulation, analysis and writing. Learn skills on bird and mammal identification, wildlife count methods, and understand the influence of habitat on species distribution and diversity.

**FEX 2a and 2b (15%)**

**Subject:** a) introduction to experimental design and monitoring in ecology and b) qualitative methods in social-ecological systems (boat expedition)

**Methods:** We will use the boat expedition for the experiment setting and execution. Students will receive a handout on the subject along with a list of potential topics for the project. In addition, students need to discuss the project with the professor to receive feedback about the theory, logistics and equipment involved during the field data collection. Potential topics include observing human-wildlife interactions in the penguin colonies; exploring the nature of community science via interviewing the boat crew on their partnership with research scientists; or participating in long-term monitoring efforts such as the phenology of flowering plants or the impacts of invasive species on nesting seabirds.

**Field Notebook (20%)**

Students will develop a comprehensive program field notebook that documents and captures their on-the-ground learning experiences and serves as a primary record of content and reflections during the course. This notebook should accompany students at all times: in the classroom, guest lectures, and the field. All class notes, field notes, data from field exercises, reflective comments and questions on course material, notes from discussions, and short written assignments should be contained in this notebook, which will serve as their main study tool. Students may want to develop sections for observations during travel, translations or words in local languages, notes to remember for directed research, cultural notes, and reflective writing on how this experience is reshaping their understanding of people and the environment. The field notebook should be separate from personal journaling.

When using citable material from a field notebook in written assignments, students should use the following format to acknowledge the source: (Person you spoke to (or your own observation), Field notes, Place, Date). Whenever possible, use the name of the person providing the information; if not possible, cite descriptively, for example: “Coastal manager on Chiloé Island.”

**Exam (30%)**

An exam will be given based on material covered in lectures, readings, and field experiences. Although the exam will be given before the last field expedition, students are still immersed in an academic experience, and will complete their field notebooks (see “Field Notebook” above) and turn them in for assessment at the very end of the course.
Grade corrections in any of the above items should be requested in writing at least 24 hours after assignments are returned. No corrections will be considered afterwards.

**Grading Scheme**

<table>
<thead>
<tr>
<th>Grade</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>95.00 - 100.00%</td>
</tr>
<tr>
<td>A-</td>
<td>90.00 - 94.99%</td>
</tr>
<tr>
<td>B</td>
<td>86.00 - 89.99%</td>
</tr>
<tr>
<td>B-</td>
<td>80.00 - 82.99%</td>
</tr>
<tr>
<td>C</td>
<td>76.00 - 79.99%</td>
</tr>

<tr>
<td>D</td>
<td>60.00 - 69.99%</td>
</tr>
<tr>
<td>F</td>
<td>0.00 - 59.99%</td>
</tr>
</tbody>
</table>

**General Reminders**

**Plagiarism** – using the ideas or material of others without giving due credit – is cheating and will not be tolerated. A grade of zero will be assigned for anyone caught cheating or aiding another person to cheat either actively or passively.

**Deadlines** – Deadlines for written and oral assignments are instated to promote equity among students and to allow faculty ample time to review and return assignments before others are due. As such, deadlines are firm; extensions will only be considered under extreme circumstances. Late assignments will incur a penalty of 10% of your grade for each day you are late. After two days past the deadline assignments will not be accepted anymore. Assignments will be handed back to students after a one-week grading period.

**Participation** – Since we offer a program that is likely more intensive than you might be used to at your home institution, missing even one lecture can have a proportionally greater effect on your final grade simply because there is little room to make up for lost time. Participation in all components of the course is mandatory, it is important that you are prompt for all activities, bring the necessary equipment for field exercises and class activities, and simply get involved.

**Course Content**

*Type:* L: Lecture and discussion, FL: Field Lecture, GL: Guest Lecture, FEX: Field Exercise, FLAB: Field lab, GP: Group project
