

THE SCHOOL
FOR FIELD STUDIES

Tropical Biome Ecology & Climate Change SFS 3691

Syllabus for Fall 2022

The School for Field Studies (SFS)
Center for Rainforest Studies (CRS)
Yungaburra, Australia

This syllabus may develop or change over time based on local conditions, learning opportunities, and faculty expertise. Course content may vary from program term to program term.

www.fieldstudies.org

© 2022 The School for Field Studies

COURSE CONTENT SUBJECT TO CHANGE

Please note that this is a copy of a recent syllabus. A final syllabus will be provided to students on the first day of academic programming.

SFS programs are different from other travel or study abroad programs. Each iteration of a program is unique and often cannot be implemented exactly as planned for a variety of reasons. There are factors which, although monitored closely, are beyond our control. For example:

- Changes in access to or expiration or change in terms of permits to the highly regulated and sensitive environments in which we work;
- Changes in social/political conditions or tenuous weather situations/natural disasters may require changes to sites or plans, often with little notice;
- Some aspects of programs depend on the current faculty team as well as the goodwill and generosity of individuals, communities, and institutions which lend support.

Please be advised that these or other variables may require changes before or during the program. Part of the SFS experience is adapting to changing conditions and overcoming the obstacles that may present. In other words, the elephants are not always where we want them to be, so be flexible!

Center Research Direction

The Centre for Rainforest Studies' research plan addresses the question: *How can the future of the Wet Tropics in a changing world be ensured?* Staff and students of SFS-CRS investigate this topic by engaging in research under three core components:

1. Understanding ecological and social systems;
2. Conflict, vulnerability and change;
3. Effective response to change.

Through our research, we aim to assist a range of stakeholders and research partners. These include local landholders; non-government conservation organisations conducting rainforest restoration or having a special interest in flora and fauna; several levels of government, particularly local and state government; regional research organisations, including universities and the Commonwealth Scientific and Industrial Research Organisation.

We aim to improve stability, sustainability, environmental awareness, and concern for natural resources in the Wet Tropics, in particular on the Atherton Tablelands. Our goal is to strengthen research, technical and practical collaboration between SFS-CRS and other research organizations, governmental agencies and non-governmental organizations to carry out this agenda.

Course Overview

In Tropical Biome Ecology & Climate Change, you will obtain a broad appreciation of the diversity and dynamics of tropical terrestrial & marine biomes. You will be introduced to the current and past distributions of tropical rainforests, dry forest, savannas and coastal biomes, their biodiversity, and their relationships with the abiotic environment, human use, present threats, and restoration practices. This course aims to bring together an understanding of the underlying ecological processes that affect different biomes with the role of human society in shaping the present and future rainforests of the Wet Tropics & the coral reefs of the Great Barrier Reef. The course will take the rainforest Australian Wet Tropics & the coral reefs of the Great Barrier Reef (GBR) as case studies to investigate this field, yet many of the skills you learn here can be transferred to other systems. Topics covered will include: biophysical determinants vegetation and coral reef distribution; past, present, and future threats to Wet Tropics rainforests & GBR; and the theory and practice of rainforest and coral restoration.

The course also has a practical component. You will be taught field techniques for carrying out field research, data analysis, and communication of results.

The course is a mixture of class lectures, field lectures, field laboratory courses, workshops, field trips, and readings to complement the material presented in the lectures. A major emphasis is on field skills, the collection, management and analyses of data, and skills of writing a scientific paper. A wide range of material will be provided and should be used to study the class topics and to acquire the desired skills. Be aware that all material covered in class, lectures, field lectures, and field trips.

Learning objectives

Following this course, students should have an understanding of:

1. the factors that influenced the origin of the Wet Tropics rainforests & GBR coral reefs;
2. the ecology of rainforest and associated ecosystems in the Wet Tropics Bioregion;
3. an overview of coral reef ecology;
4. how climate change is affecting these biomes in Australia;
5. restoring terrestrial and marine ecosystems

Themes

The Tropical Biome Ecology & Climate Change course is divided into two themes, which address the history of human impacts in the Wet Tropics and the justifications for conservation and restoration, followed by looking at issues of management of tropical forest, freshwater landscapes and coral reefs to maximize the ecological and economic effectiveness of restoration efforts.

The first theme is used to give you a background in the processes that shaped the rainforests, freshwater and marine ecosystems of the Wet Tropics and gives you an insight in how these ecosystems work. With this understanding, the human impacts on the Wet Tropics are put into an ecological context. In short, this half is designed to familiarize you with the various ecosystems of the Wet Tropics and how humans have affected them.

The second theme puts you into the role as “manager” and attempts to train you to be part of the solution. As such, we critically evaluate the different techniques used today to try and mitigate the threats to these ecosystems in a most effective way.

Assessment

Most of the assessments will be based on individually written or orally presented work.

Below is a table of the assessments for this course.

Assessment Item	Value (%)
Field exercise & data interpretation writeup	20
iNaturalist assignment + plant herbarium collection	15
Plant ID quiz	10
Reflective blog post	10
3 minute talk	10
Final Exam	30
Participation	5
Total	100

Field exercise and data interpretation

One of the main aims of our study abroad program is to give you a keen appreciation of the diversity of tropical forests and their structure. One of the best ways to get such an appreciation is to construct a profile of a forest using data collected in the field. This includes setting up plots to sample vegetation and measuring and identifying plants. By going through such an exercise, you will learn valuable skills in setting up research plots. You will also learn to analyze and interpret data you collect from your study plots during the course. In this assignment you will be required to submit a profile diagram that you will construct from your own data, and also write a short report that presents and interprets the

data you collect. Note that participation in fieldwork and peer review contributes towards your grade in this assignment.

iNaturalist assignment & plant collection

This assignment brings you back to the basics. Good science is good observation. Good observations come with good notes. The greatest scientists in the fields of natural science such as botany and zoology are known for their careful collections of specimens and meticulous notes. This assignment therefore aims to give you a keen appreciation of this fundamental practice of making biological collections and observation recording. Also, your observations will contribute towards a global (and also local) database.

Plant ID Quiz

The purpose of this quiz is to develop your skills in identifying the flora of our rainforest by using spot characters and identification tools. As the rainforest of Atherton Tablelands is home to a diverse flora the familiarization with the most common species will help to better understand the roles these plants play in the ecosystems of this region. Plant ID skills depends on attention to detail and trains your observational powers. These skills are applicable in forest regions beyond the Australian tropics. We will conduct an intensive plant ID workshop early in the course to practice techniques of plant identification.

Reflective blog post

This assignment provides you an opportunity to synthesize your experiences of your trips visiting the coastal environments of the Wet Tropics and Great Barrier Reef. The post should be between 600-1000 words and contain figures such as schematics or photographs and a few references.

3MT

The purpose of these examinable components are to help you develop your skills in scientific presentation. For this 3 minute talk, a range of topics related to tropical biomes will be available for you to choose from.

Final Exam

During the final exam you will be tested on material presented in lectures, field lectures and excursions. Answering questions will require critical and analytical thinking across the various teaching units.

Grading Scheme

A	95.00 - 100%	B+	86.00 - 89.99%	C+	76.00 - 79.99%	D	60.00 - 69.99%
A-	90.00 - 94.99%	B	83.00 - 85.99%	C	73.00 - 75.99%	F	0.00 - 59.99%
		B-	80.00 - 82.99%	C-	70.00 - 72.99%		

General reminders

Plagiarism: Using the ideas and material of others without giving due credit, is cheating and will not be tolerated. A grade of zero will be assigned if anyone is caught cheating or aiding another person to cheat either actively or passively (e.g., allowing someone to look at your exam).

Deadlines for written and oral assignments are instated to promote equity among students and to allow faculty ample time to review and return assignments before others are due. As such, deadlines are firm and extensions will only be considered under extenuating circumstances. If you believe that you have been prevented from completing your work on time for reasons beyond your control (e.g. illness), make sure that you discuss this with the relevant faculty member as soon as possible, and certainly before the assignment is due. Late assignments will incur a penalty proportional to the length of time that they are late. This means an assignment that is one day late when students were given two days to work on it will have 50% of total points removed from the grade awarded for that assignment, and an assignment that is 2 hours late when two full days (16 hrs) were allocated to work on it will have 12.5% of total points removed from the grade.

Course components

The column Readings contains suggestions to deepen and expand the knowledge. **Compulsory reading material (indicated below in bold) is provided as Pdf files on the Student Drive.**

L: Lectures, **FL:** Field Lectures, **FW:** Fieldwork, **EX:** Exams, **REV:** Review, **FLAB:** Field Lab **WS:** Workshop, **GL:** Guest lecture

Code	Titles of Lectures /Field Exercises	Time (hrs.)	Type	Readings
	Course Overview This lecture gets you into the swing of discovering Australia's natural assets and exploring ecological patterns and processes	1.0	L	Attiwill & Wilson (2006). Ecology. An Australian Perspective. (2 nd ed). Oxford University Press.
	Past and current landscapes of the Atherton Tablelands A tour on the Tablelands will show you the main land formations of this area. We will see different geology and soil types and discuss how their distribution has affected the rainforest distribution and land uses. We will watch a video to see how local communities became aware of the values of their forests and trying to restore them.	4.5	FL and Video	Stephensons, P.J. (1989). Rocks and Landscapes of the Cairns District.- Qld Dept. of Mines – CRS Library ECO081; Haberle, S. (2005). A 23,000-yr pollen record from Lake Euramoo, wet tropics of NE Queensland, Australia. Quaternary Research, 64, 343-356.
	Biomes 1: The Tropical Rainforest You will understand the main factors that determine the occurrence of a	2.0	L	Richards, P. W. (1952). The tropical rain forest. <i>The tropical rain forest: an ecological study</i> . Cambridge University Press. Tracey, J. G. (1982). Vegetation of the humid tropical region of north Queensland. CSIRO,

Code	Titles of Lectures /Field Exercises	Time (hrs.)	Type	Readings
	Rainforest in an area. You will learn how to recognize and classify this important biome and learn about its relevance			Melbourne. Adam, P. (1992). <i>Australian rainforests</i> . Oxford University Press. Bowman, D.M.J.S. (2000) . Australian rainforests: islands of green in a land of fire. Cambridge University Press. (Selected chapters)
	Biomes 2: Wetlands and Mangroves We will explore what is considered a freshwater and a coastal wetland, and understand in which environmental conditions each type occurs. You will learn why this is such a unique habitat where the plants need to deal with a waterlogged condition. We will explore the connection between land and sea.	2.0	L	Keddy, P.A. (2010) . Wetland ecology: principles and conservation (2nd ed.). New York: Cambridge University Press. McLeod, E., et al. (2011) . A blueprint for blue carbon: toward an improved understanding of the role of vegetated coastal habitats in sequestering CO ₂ . <i>Frontiers in Ecology and the Environment</i> , 9, 552-560.
	Biomes 3: Dry forests and Savanna Let's talk about fire: you will navigate on one of the most widespread biome in Australia, the Savanna, and understand how fire plays an important role in this Biome. You will also learn the specific features of Dry forest and why this important biome has its biodiversity neglected.	2.0	L	Skarpe, C. (1992) .
