Mountain Ecology
SFS 3060

Syllabus
4 credits

The School for Field Studies (SFS)
Center for Climate and Sustainable Futures (CCSF)
Paro, Bhutan

This syllabus may develop or change over time based on local conditions, learning opportunities, and faculty expertise. Course content may vary from semester to semester.
COURSE CONTENT SUBJECT TO CHANGE

Please note that this is a copy of a recent syllabus. A final syllabus will be provided to students on the first day of academic programming.

SFS programs are different from other travel or study abroad programs. Each iteration of a program is unique and often cannot be implemented exactly as planned for a variety of reasons. There are factors which, although monitored closely, are beyond our control. For example:

- Changes in access to or expiration or change in terms of permits to the highly regulated and sensitive environments in which we work;
- Changes in social/political conditions or tenuous weather situations/natural disasters may require changes to sites or plans, often with little notice;
- Some aspects of programs depend on the current faculty team as well as the goodwill and generosity of individuals, communities, and institutions which lend support.

Please be advised that these or other variables may require changes before or during the program. Part of the SFS experience is adapting to changing conditions and overcoming the obstacles that they may present. In other words, this is a field program, and the field can change.
**Course Overview**

The kingdom of Bhutan lies in the eastern Himalayan typically characterized by extensive and numerous mountains and valleys, world’s highest peaks and a diversity of vegetation and wildlife. The mountain environments dominate Bhutan and shape both the culture and ecology of the land. Within this compact and mountainous country, are an extraordinary diversity of ecosystems and habitats; Bhutan and the Eastern Himalayan region are globally recognized as one of the hotpots for the biodiversity.

In this course, we focus on mountains. What are the processes that form mountains and shape their ecological communities? We will begin by studying the physical environment of mountains — the geology and climate. Upon gaining an understanding of the physical environment, we will investigate the effect of elevation gradients on vegetation and highlight special features of mountain animals and the interaction between habitat and animal communities. How do mountains influence the distribution of biodiversity and how do scientists study ecology in mountainous environments? Finally, what are the threats to mountain regions in a rapidly changing world and what conservation tools are scientists and conservation biologists implementing to protect sensitive mountain environments and species.

**Learning Objectives**

The objective of this course is to provide students the background and tools necessary to understand and study the mountain environments of Bhutan and to learn its fauna and flora. Through classroom lectures, discussions, seminars, field lectures, and field exercises, we will examine what makes the Eastern Himalayan region unique. Classroom and field lectures will provide core concepts and tools for inquiry, whereas field exercises will reinforce these concepts and allow students to practice scientific inquiry skills and data collection. In this course students will develop a conceptual and practical understanding of the ecological complexity of the Eastern Himalaya region. Specific learning objectives are the following:

1. Understand the geological history and biogeography of mountain regions in general and the Eastern Himalayan region specifically, while distinguishing characteristics of mountain environments that explain species distributions and speciation,
2. Learn the natural history, biology and ecology of organisms in Bhutan,
3. Employ field research methods and analytical tools, including qualitative and quantitative methods scientists and managers use to study and conserve biodiversity,
4. Gain an understanding of the challenge’s mountain communities face and the unique and progressive conservation efforts being made in Bhutan and
5. Practice the scientific method, gain experience conducting collaborative research in a multidisciplinary learning environment and advance science communication skills.

**Assessment**

Our goal is to conduct ongoing assessment of student learning throughout the course, and provide timely and constructive feedback. Some assignments encourage students to work together, to share ideas and knowledge. This allows students to take advantage of the range of backgrounds within the group. Assessment will be conducted on an individual basis, unless otherwise stated. The final course grade will be based on the following:
## Assessment Item

### Participation (10%)

During this program we will travel through many eco-regions and rural communities. We expect that you will be an active observer, constantly observing the landscape, livelihoods, and culture and participating in discussions regarding these observations. Active participation includes constructive engagement with the full range of course activities, respectful awareness of Bhutanese cultural context, and responsible behavior as a group member who is involved in others’ learning. There will be opportunities throughout the semester for constructive feedback.

### Graded Field Exercises (FEX) (60%, 15% each)

Field exercises are designed for students to learn and practice a series of different field techniques to collect data on biodiversity. You will learn how to use these techniques, collect data, and perform statistical tests and interpretation of the results. Handouts will accompany each FEX, which will ask students to interpret their findings and reflect on study design and improvement.

#### Plant Identification and Quiz (15%)

This exercise will enable students to identify the main plant species and major life zones of Bhutan. The students will be given field lectures on plant identification around the Centre’s campus, along the elevational gradient covering temperate to sub-tropical region. There will be plant identification quiz in the class using sample specimens. Individual student will pick a favorite plant species and a write short description illustrating its phylogeny, habitat where it grows, its uses and how it is propagated. A detailed handout will be provided for this FEX.

#### Measuring Plant Communities Along an Elevation Gradient (15%)

Elevation transects are important natural experiments for ecologists to understand plant and animal responses to environmental gradients. We will observe plant and animal distributions and document changes in species occurrence and richness along a gradient spanning the mountain top and valleys and consider how climate change may affect these communities. We will document biodiversity along elevational gradient by dividing the class into groups. Each group will conduct a detailed survey of life forms in series of plots. Students will identify the plant species and measure woody trees for their DBH, height and other attributes of the trees within the plot. Additionally, the group will collect and record ecologically important morphological characteristics. Using these data, the students will estimate total biomass, calculate biodiversity index and other ecologically important bio-indicators. The surveys will cover altitudinal gradient from valley bottom to mountain top. Each group should produce a comprehensive written report covering different aspects of the exercise.
**Measuring Freshwater Macroinvertebrates (15%)**
Aquatic invertebrate communities are determined by resources available in streams, rivers, and lakes and are often influenced heavily by pollution. We will survey aquatic sites, observing how flow rates influence invertebrate communities. Students will use standardized survey techniques and keys to identify aquatic invertebrate species and summarize their findings in a short report.

**Forest Succession After Fire (15%)**
Disturbance plays a vital role in ecosystem dynamics. Fire is one of the most important disturbances in Bhutan. Understanding its impact and providing practical application of forest fire is fundamental to forest management especially in dry region of the country. Students will learn the ecological processes of forest succession after a forest fire. The students will conduct a field survey in groups and produce a written report for a scientific journal.

**Ungraded Field Exercises (FEX)**

**Measuring Terrestrial Macroinvertebrates (Ungraded)**
Terrestrial macro invertebrates are critical in decomposition, nutrient cycling, physical processes, and disturbance regimes. Soil invertebrates modulate the environment such as soil temperature, moisture, nutrients, plant species composition, soil compaction, mixing, trace gas production, aggregate formation and stability, soil crusting, aeration, runoff, carbon storage, organic matter stabilization, macropores, water transport, and microbial community structure to varying degrees. There are also sources of food within the complex food chain. Insects are also important ecosystem regulators via the action of many species as powerful herbivores. Therefore, understanding their ecological roles becomes critical for their conservation. We will learn a few basic methods to quantify terrestrial macro invertebrates. A detailed guideline will be provided to conduct this survey.

**Avian Mist-netting and Field Census Techniques (Ungraded)**
Birds have become the model vertebrate group in ecology because of their ubiquity, diversity, and ease of observation. Yet, catching them, which is often needed for population studies, can be tough. We will spend at least two mornings in capturing the birds in mist net and learn how to handle the captured birds, as well as how to determine age, sex, and score molt on certain species. Between net checks, we will observe and identify bird species on campus, as well as learn how to conduct standardized observational transect and point count surveys.

**Surveying Large Mammals Using Camera Traps (Ungraded)**
Birds have become the model vertebrate group in ecology because of their ubiquity, diversity, and ease of observation. Yet, catching them, which is often needed for population studies, can be tough. We will spend at least two mornings in capturing the birds in mist net and learn how to handle the captured birds, as well as how to determine age, sex, and score molt on certain species. Between net checks, we will observe and identify bird species on campus, as well as learn how to conduct standardized observational transect and point count surveys.

**Final Exam (30%)**
One final comprehensive final exam will be administered, at the end of the course. You will be examined on what you have been exposed to in class (lectures, discussions, etc.), the field, and readings. The exams will challenge students to draw on multiple concepts and experiences, and to synthesize information.
### Grading Scheme

### General Reminders

**Field notebook** - You will develop a comprehensive field notebook that documents and captures your on-the-ground learning experiences and serves as your primary record of content and reflections during the course. This notebook should always accompany you: in the classroom, guest lectures, and the field. All class notes, field notes, data from field exercises, reflective comments and questions on course material, notes from discussions, and short written assignments should be contained in this notebook, which will serve as your main study tool. You may want to develop sections for observations during travel, translations or words in local languages, notes to remember for your directed research, cultural notes, and reflective writing on how this experience is reshaping your understanding of people and the environment. Keep this separate from any personal journaling you may write.

When using citable material from your field notebook in written assignments, use the following format to acknowledge the source: *(Sonam Phuntsho, Field notes, 12 October 2014)*. Whenever possible, use the name of the person providing the information; if not possible, cite descriptively, for example: “A Cordyceps collector of Soe-Yaktsa.”

**Floral and faunal identification** - A fundamental skill in ecology is the ability to identify organisms. In Mountain Ecology, we will focus on forest and common understory plant community identification, mammal, bird, terrestrial and freshwater macro-invertebrate identification, because these are the most recognizable and best-known taxonomic groups in the area. Field and laboratory practicums will be used for identification purposes.

**Readings** – You are expected to have read all the assigned research articles prior to each class. All readings are available as PDFs on the Student Drive. Readings might be updated or changed during the course of the semester. Readings from textbook chapters are for reference/supplemental learning. Not all material will be explicitly taught during lectures, material from textbook chapters not covered in lecture will NOT be on exams. Additional readings could be assigned.

**Plagiarism** – Using the ideas and material of others without giving due credit is cheating and will not be tolerated. A grade of zero will be assigned if anyone is caught cheating or aiding another person to cheat actively or passively (e.g., allowing someone to look at your exam). All assignments unless specifically stated should be individual pieces of work.

**Deadlines** – Deadlines for FEX assignments will be at midnight two days after the actual FEX unless otherwise stated in assignment. Late assignments will incur a 10% penalty for each day that they are late. Assignments will be handed back to students after a one-week grading period at the latest.
Participation – Since we offer a program that is likely more intensive than you might be used to at your home institution, missing even one lecture can have a proportionally greater effect on your final grade simply because there is little room to make up for lost time. Participation in all components of the course is mandatory, it is important that you are prompt for all activities, bring the necessary equipment for field exercises and class activities, and simply get involved.

Course Content

Type- L: Lecture, FL: Field Lecture, GL: Field Lecture, FEX: Field Exercise, D: Discussion

| ME 1 | Course Overview  
Course Objectives, Syllabus, Field Exercises, Deadlines, Questions and Expectations for semester. | L; D | 1:00 | |
| ME 2 | Introduction to Mountain Ecology  
Why are mountains located where they are? How did they get there? We’ll explore the physical origins of mountains, theories of mountain building, and how our changing ideas about mountains and their genesis have shaped our engagement with them. | L; D | 1:15 | Price et al. Chapter 2  
Foggin,2016  
Sayre et al, 2018 |
| ME 3 | Mountain Geology and Soils I  
We will learn the basics of mountain building processes and their implication on mountain ecology. | L; D | 1:15 | Smethurst, 2010 |
| ME 4 | Mountain Geology and Soils II  
We will learn about basics of Himalayan geology and soils. Discuss various implications of geology and soil management. | L; D | 1:15 | Crowther et al, 2019  
Harrison, 1992 |
| ME 5 | Mountain Climate  
How do mountains affect climate? How are mountains shaped by climate? What are the geological processes in mountainous ecosystems? We will examine how elevation affects atmospheric processes and discuss an ecological manifestation of climate change on mountain systems. | L; D | 1:15 | Spicer, 2017  
Barry, 2008 (Ch.1 and 5)  
Srinivasan, 2013 |
| ME 6 | Adaptations of Organisms in the Mountains  
What are the basic requirements for plants and animals for their growth and development? How do they adapt to different environment? What is the adapting mechanism of plants and animals in the mountainous environment? | L; D | 1:15 | Halbritter et al, 2018  
Fjeldsa et al, 2013  
Badgley, 2008  
Manish and Pandit, 2018 |
| ME 7 | Field Survey Method I  
We will learn different survey methods to study animal communities and learn how to handle basic equipment for measurement of various environmental variables. We will also learn to develop data recording methods. | L; D | 1:15 | Lohmus et al, 2018 |
| ME 8 | Field Survey Method II  
We will learn about different sampling methods for ecological studies of plant communities including dendrochronology and learn how to handle different equipment used for surveys. | L; D | 1:15 | Arenas-Castro et al, 2015 |
